sby IMPROVER at a Glance

sbv IMPROVER stands for systems biology verification and Industrial Methodology for Process Verification in Research. It is a robust methodology that verifies systems biology approaches using double-blind performance assessment and applies the wisdom of crowds to solve scientific challenges [1] [2]

The project team includes scientists from Philip Morris International's (PMI) Research and Development department and IBM's Thomas J. Watson Research Center. The project is funded by PMI.

What constitutes a sby IMPROVER Challenge?

- a scientific problem presented to the community
- often comes with a "Gold Standard" or a solution to the challenge, to which each prediction is compared

The Approach has the following Advantages

- nucleates a community around a given scientific
- allows for unbiased benchmarking
- establishes state-of-the-art technology and knowledge
- complements the classical peer-review process

The sbv IMPROVER Context

Real world Challenges mapped against the Research Vision

The first sby IMPROVER Challenge: **Diagnostic Signature**

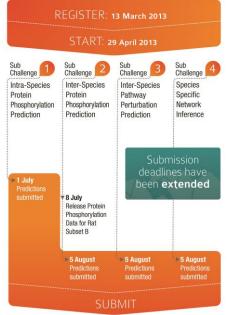

The goal of the Diagnostic Signature Challenge was to assess and verify computational approaches that classify clinical samples based on transcriptomics data. It was successfully closed at the end of 2012 after 54 scientific teams from across the world had participated. The best performing teams were announced at the Symposium 2012 in Boston, USA.

The second sbv IMPROVER Challenge: **Species Translation**

The aim of the Species Translation Challenge is to:

- identify rules which map measurements derived from systematic perturbations in one species to another
- quantify the translatability between species
- understand the limitation of species translatability

The Species Translation Challenge addresses the translatability of findings between rat and human model systems. The four Sub Challenges address different aspects of this problem:

Species Translation Challenge Roadmap

The third sbv IMPROVER Challenge: **Biological Network Verification**

Biological network perturbations play a fundamental role in today's systems-based biology, pharmacology and toxicology:

- networks link experimental measurements and a priori knowledge [3]
- network models consist of qualitative causal relationships between biological entities to represent current scientific knowledge

The purpose of the Network Verification Challenge is

- engage the scientific community in the review of networks
- improve the representation of fundamental biological processes involved in respiratory disease

Network Verification Challenge at a Glance

sbv IMPROVER Symposium 2013

sbv IMPROVER October Symposium 2013 The Species Translation Challenge Understanding the Limits of Rodent Models for Human Biology Join us at the Grand Resort Lagonissi Athens, Greece for:

- Presentation of Awards
 Renowned Keynote Speakers
 Workshop for Network Verification

To register and find more information visit: www.sbviprover.com/symposium2013

Call for Action

- join the sbv IMPROVER community
- register for the Species Translation Challenge Symposium in Athens, Greece
- participate in the Network Verification Challenge when it opens in October 2013

The sbv IMPROVER project, the website and the Symposia are part of a collaborative project designed to enable scientists to learn about and contribute to the development of a new crowd sourcing method for verification of scientific data and results. The project team includes scientists from Philip Morris International's (PMI) Research and Development department and IBM's Thomas J. Watson Research Center. The project is funded by PMI.
